BALTIC RACING
ENGINEERED FOR SUCCESS

Values for astable operation at 4kHz.
RA = R19
RB = R21
C = C20

tH = 0.693 * (RA + RB) * C
tL = 0.693 * RB * C

tL/tH = RB/(RA + RB))

f = 1.44/((RA + 2*RB) * C)

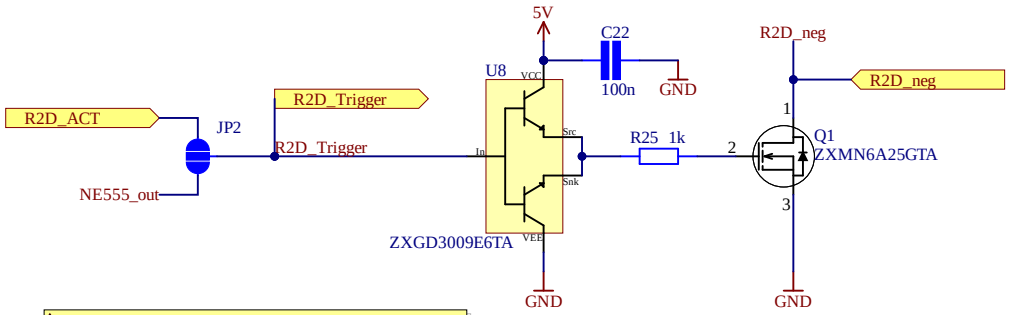
Approx DC of 50%: RA = RB * 0.1

tL/tH = RB / (RB * 1.1) = 0.9091

with RB = 10k and f = 4kHz

4kHz = 1.44/((1k + 2*10k) * C)
4kHz = 1.44/(21k * C)
C = 1.44/(4kHz + 21k)
C = 17nF

C (4kHz) = 17nF
C (3kHz) = 23nF
C (2kHz) = 34nF
C (1kHz) = 69nF



R25_max = 1/(2*pi*fs*Ciss)
With Ciss = 1063pF (Datasheet of MOSFET)
and fs = 4kHz (Apprx freq. of R2D)

R25_max = 37k

Lowering R25 increases switching frequency fs and power dissipation

Simulation is recommended to watch power dissipation
